Simple Password Length Validator

1. Problem Statement

Read a sample password and check whether it contains at least 8 characters. Display a suitable message.

2. Objectives

1. Read a password string.
2. Use the `len()` function to count characters.
3. Check the minimum length using a conditional statement.
4. Display the validation result.

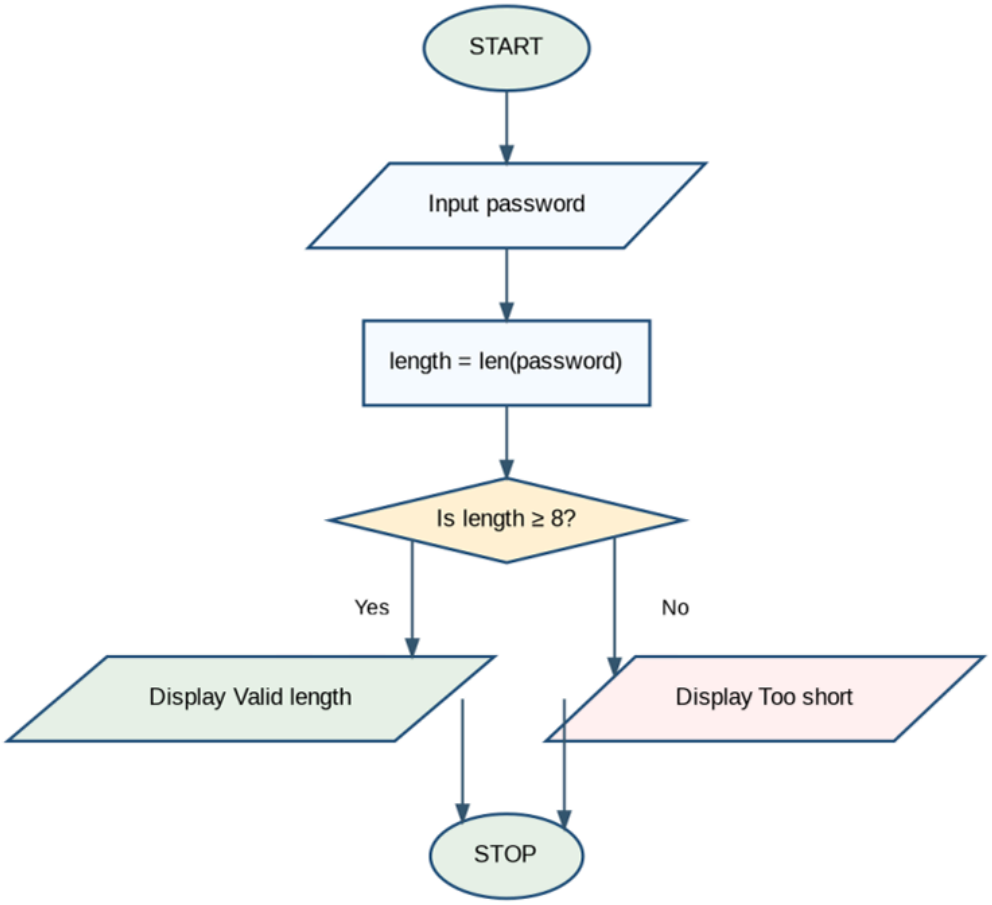

3. Assumptions

1. Minimum password length is 8 characters.
2. This is only a length check and does not test password strength.

4. Algorithm

1. Start.
2. Read the password.
3. Find its length using `len()`.
4. If length is at least 8, display Valid length.
5. Otherwise, display Too short.
6. Stop.

5. Flowchart

None

6. Pseudocode

None

```
INPUT password
length = LEN(password)

IF length >= 8 THEN
    DISPLAY "Valid length"
ELSE
    DISPLAY "Too short"
END IF
```

8. Test Case and Expected Output

Input:

```
None
Enter a sample password: campus123
```

Output:

```
None
Number of characters: 9
Password length is valid
```

Explanation: The password `campus123` contains 9 characters, which is greater than the minimum length of 8 characters.

9. Conclusion

The program uses string input, the `len()` function, and a conditional statement to validate password length. It displays whether the password meets the minimum length requirement of 8 characters.
